

Proposal Intelligence & Sales Automation.

How Auxion converts intelligence into world-class consulting proposals — and moves them from first contact to signed engagement to automatic onboarding. AIS-003 specified how a recommendation is scored; this document specifies how an approved, prioritized set of recommendations becomes a **personalized, priced, defensible proposal** that closes. Every proposal element inherits the evidence trace: nothing is asserted to a client that the engine cannot support.

28 ELEMENTS 6 PHASES 9-STATE MACHINE CRM PIPELINE SYNC AUTO-ONBOARDING

GOVERNING RULE

A proposal is a commitment, not a pitch. Every line is traceable to an approved recommendation and its evidence. The engine drafts; a human approves before anything reaches a client. Pricing, scope, and claims are derived — never invented to win a deal.

01 FROM INTELLIGENCE TO COMMITMENT

WHY BEFORE HOW

Why proposals are the last mile

Intelligence that never becomes a signed engagement is wasted. AIS-001 through 003 produce a scored, prioritized set of moves; the proposal is where that intelligence is converted into a decision the client can say yes to. It is the highest-leverage document Auxion produces and the one most exposed to the client.

Why derivation beats persuasion

A proposal that overstates to win the deal destroys the trust the evidence was built to earn. Every element — price, scope, ROI, proof — is derived from the recommendation record and its evidence, so the proposal is as defensible in a negotiation as it is compelling on first read.

Why the whole path is one object

Discovery, drafting, negotiation, signature, and onboarding are usually separate tools with lossy handoffs. Auxion models the proposal as a single versioned object that carries its evidence and state across every stage, so nothing is re-keyed and nothing is lost between the scan and the active engagement.

03 PROPOSAL INTELLIGENCE

HOW IT ADAPTS

A proposal is not a template fill. The engine composes it from the recommendation set, the client's context, and the deal's signals — selecting deliverables, shaping price, and generating packages that fit this client, always within the evidence.

How proposals adapt

The engine reshapes structure, depth, and tone to the client's industry, size, buying stage, and the deal's signals — a founder-led SMB and an enterprise committee get different documents from the same evidence.

How AI selects deliverables

Deliverables map one-to-one from the approved, prioritized moves; the engine includes the highest-priority set that fits the client's budget and readiness, and defers the rest.

How pricing changes

Price is derived bottom-up from deliverable cost and margin rules, then adjusts live as scope is added or cut in negotiation — never a fixed sticker.

How optional packages are generated

Good/better/best tiers are assembled from nested subsets of the move set, each a coherent outcome at its own price and ROI, so the client chooses ambition rather than haggling.

How upsells are suggested	Deferred moves and newly-opened gaps surface as evidence-backed add-ons at natural moments, sized by opportunity — offered, never forced.	How implementation phases are created	Phases are cut along the move dependency DAG so prerequisites precede dependents and each phase delivers standalone value.
How project plans are generated	The timeline, owners, and milestones roll directly into a project plan on acceptance, seeding delivery from the same object.	How contracts connect	The signed scope populates the contract template; terms, price, and deliverables are bound to the agreed version, not re-entered.
How onboarding begins automatically	Signature fires the onboarding workflow — accounts, kickoff, data access, and the first delivery phase — with no manual handoff.	How it stays honest	Every adaptive choice — deliverable, price, upsell — remains traceable to a recommendation and its evidence; personalization changes framing, never facts.

04 PROPOSAL STATE MACHINE

9 STATES

A proposal is a versioned object moving through defined states. Every transition is gated, logged, and reversible where the business allows.

STATE	ON EXIT →	GATE / RULE
Draft	In Review	Engine-composed from approved moves; editable by the operator. Exits when submitted for approval.
In Review	Approved / Draft	Internal approval gate; a rejection returns it to Draft with comments.
Approved	Sent	Cleared for the client; scope and price locked to this version until a revision is opened.
Sent	In Negotiation	Delivered to the client; awaiting response. Client views and comments are tracked.
In Negotiation	Revised / Accepted	Client requests changes; live re-pricing shows trade-offs. Exits on agreement or a new revision.
Revised	In Review	A new version re-derives dependent scope, price, and timeline; re-enters approval.
Accepted	Signed	Client agrees to the final version; awaiting signature. No further edits without reopening.
Signed	Onboarding	Digital signature captured; scope locked, contract generated, onboarding fired.
Onboarding	—	Terminal for sales; engagement becomes active and delivery begins. Handoff to project plan.

05
 SALES PIPELINE INTEGRATION

6 STAGES

Proposal state maps onto the sales pipeline, so the same object drives both the document and the forecast. Each stage carries a weighted probability and syncs bidirectionally with the CRM.

Qualified
15%

Lead scored a fit; scan evidence assembled. Maps to Draft.

Proposal Sent
35%

Approved proposal delivered to the client. Maps to Sent.

Negotiation
55%

Client engaged, discussing scope and terms. Maps to In Negotiation.

Verbal / Accepted
80%

Client has agreed pending signature. Maps to Accepted.

Closed Won
100%

Signed; engagement active. Maps to Signed / Onboarding.

Closed Lost
0%

Declined or lapsed; reason captured for learning. Terminal.

Bidirectional sync	Proposal state and pipeline stage stay in lockstep; a change in either updates the other.	Weighted forecast	Each stage's probability times deal value rolls into a pipeline forecast the firm can trust.
Activity capture	Views, comments, and revisions log against the deal automatically — no manual CRM entry.	Loss learning	Closed-lost reasons feed the Learning agent to improve future qualification and pricing.

06 CONTRACTS, SIGNATURE & AUTO-ONBOARDING

ACCEPT → ACTIVATE

Acceptance is a trigger, not an endpoint. On signature the engine assembles the contract from the agreed scope and starts onboarding automatically — the client crosses from prospect to active engagement without a manual handoff.

A END-TO-END WORKFLOW

INTELLIGENCE → ENGAGEMENT

INTELLIGENCE (FROM AIS-001...003)

Scan → Findings → Recommendations → Approved moves

PROPOSAL COMPOSITION

Engage → Compose → Price → Persuade → Personalize

CLOSE

Approve → Send → Negotiate → Accept → Sign

ENGAGEMENT

Contract → Project plan → Provision → Kickoff → Deliver
