

Continuous Monitoring & the Autonomous Advisor.

How Auxion becomes a 24/7 autonomous business advisor. The first five specifications describe a scan — a moment of intelligence. This document turns that moment into a **standing relationship**: the engine watches continuously, distinguishes signal from noise, refreshes recommendations and proposals as the world changes, and reports on a cadence like an advisor who never sleeps. Everything it observes inherits the AIS-001 evidence discipline; everything it raises is prioritized by the AIS-003 mathematics.

24/7 MONITORING 19 MONITORS ALERT PRIORITY MATH PREDICTIVE CADENCED REPORTING

GOVERNING RULE

Monitor everything; alert on almost nothing. The advisor earns attention by raising only what is real, material, and confident — a change that crosses a threshold, survives a re-check, and matters to the business. Noise is filtered, not forwarded.

01	FROM SCAN TO STANDING ADVISOR	WHY BEFORE HOW
Why a scan is not enough		
A one-time scan ages the moment it is delivered. Businesses and markets move continuously, so intelligence must too. The autonomous advisor converts Auxion from a report into a relationship — the value compounds because the engine never stops watching, remembering, and revising.		
Why alert discipline is the product		

A monitor that cries wolf is worse than none — it trains the client to ignore it. The hardest engineering here is restraint: watch every dimension, but push only changes that are real, confident, material, and timely. Everything else goes to the timeline for context, not to the client’s inbox.

Why the advisor must be autonomous

A human cannot watch nineteen dimensions across an account continuously. The advisor does the watching, the detection, the refresh, and the drafting automatically, and brings a human in only at the moments that need judgment — approving an alert-driven recommendation or presenting a quarterly review.

02 THE MONITORING ENGINE

SCHEDULED + EVENT-DRIVEN

Monitoring runs on two triggers: a scheduled cadence per dimension, and event-driven scans fired by an external signal. Both reuse fresh cached evidence and only re-fetch what may have moved.

SCHEDULED SCANS

Each dimension has its own cadence set by volatility — reviews and performance often, brand and structure rarely. The scheduler reconciles cadences into efficient batched runs within budget.

EVENT-DRIVEN SCANS

A webhook, a competitor move, a traffic anomaly, or a client action fires a targeted scan immediately, ahead of the next scheduled run, scoped to the affected dimension.

19 MONITORS · EACH WITH A CADENCE, THRESHOLD & DETECTOR

Competitor	daily	Set membership, moves, and relative position shifts.	SEO	daily	Indexability, ranking surface, and keyword movement.
Reviews	hourly	New reviews, rating shifts, and sentiment change.	Website	hourly	Availability, structure, and content changes.
Performance	hourly	Load timing, weight, and rendering regressions.	Security	daily	TLS, headers, and newly exposed misconfiguration.
Brand	weekly	Positioning, tone, and message consistency drift.	Social	daily	Presence, activity, and audience-signal movement.

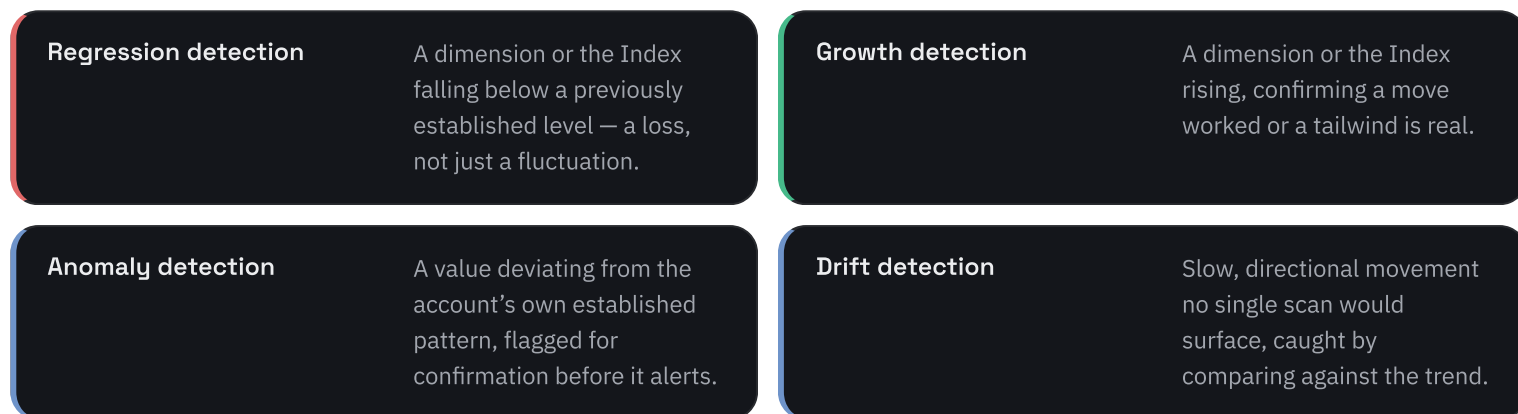

Marketing	daily	Observable campaign and channel-mix changes.	Automation	weekly	Capture, response, and process-automation changes.
Financial indicators	monthly	Observable pricing, packaging, and margin signals.	Trend	weekly	Direction across dimensions the Index depends on.
Traffic	hourly	Volume and pattern anomalies against baseline.	Conversion	daily	Funnel and form-completion movement.
Content	weekly	Freshness, depth, and coverage changes.	Technology	weekly	Observable stack and infrastructure changes.
Listings	weekly	Google Business and directory completeness.	Compliance	monthly	Accessibility and policy-surface changes.
Index	on-change	Composite health recomputed on any dimension move.			

03 DETECTION CLASSES

SIGNAL FROM NOISE

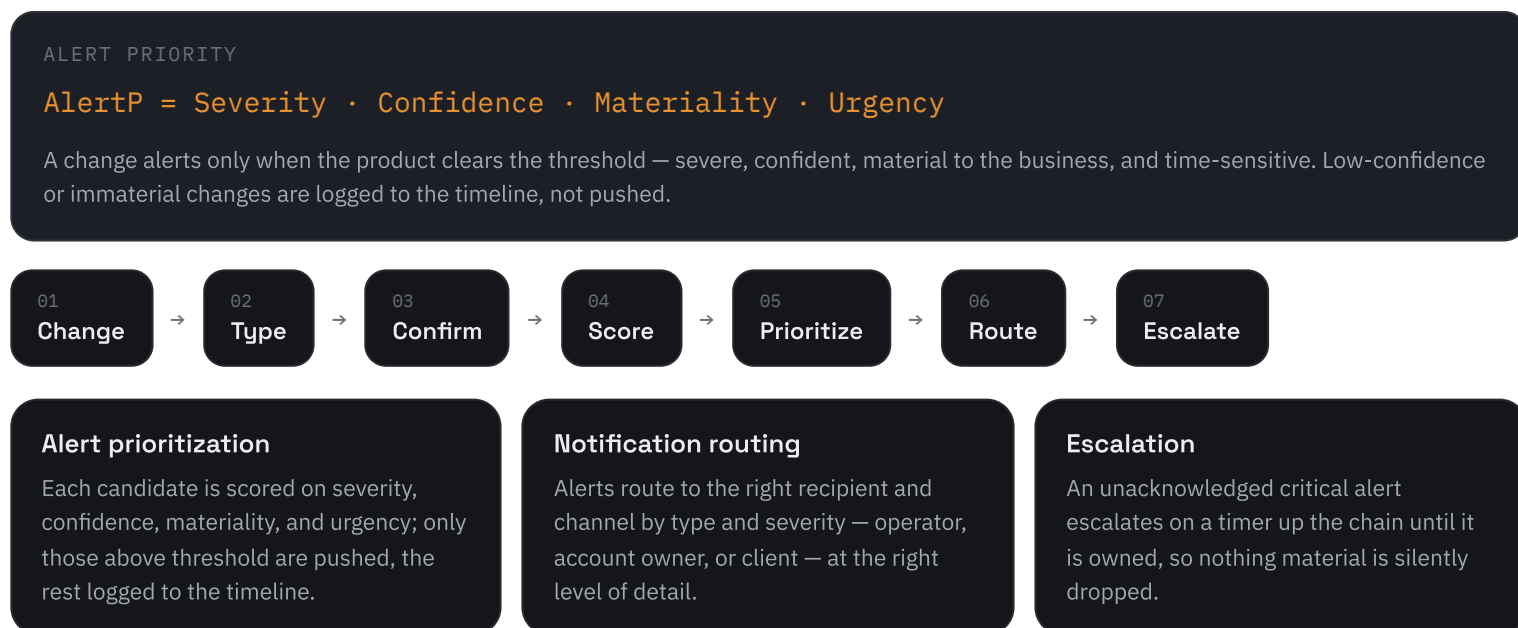

Every monitor feeds the same detection layer, which classifies what changed. A raw delta is not an alert until it is typed, thresholded, and confirmed.

Opportunity detection	A newly opened gap against a competitor or benchmark that the client can capture — sized by the AIS-003 opportunity model.	Threat detection	A competitor advance or external change that endangers the client's position, with its exposure path.
-----------------------	--	------------------	---

04 ALERT ARCHITECTURE

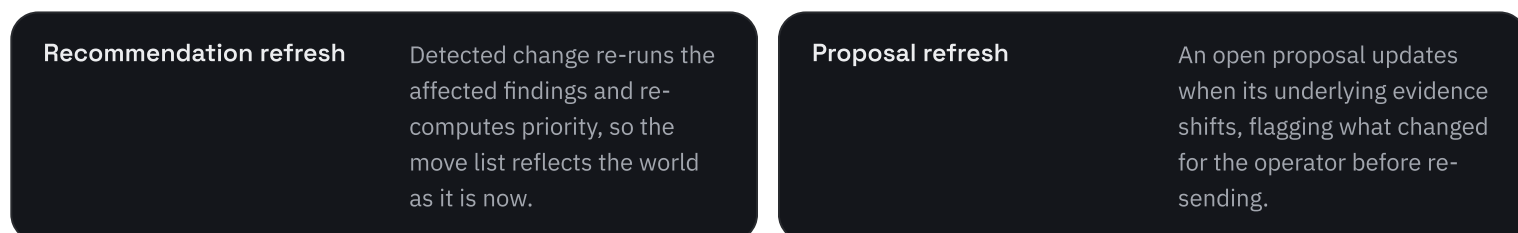

PRIORITIZE · ROUTE · ESCALATE

05 RECOMMENDATION & PROPOSAL REFRESH

LIVING OUTPUTS

Detected change does not just alert — it revises the advice. Recommendations recompute, priorities re-rank, and proposals update, so the client's plan is always current with the evidence.

Autonomous planning

The advisor re-sequences the plan around completed and newly-urgent moves, keeping the roadmap live.

Change-linked advice

Every refreshed recommendation links to the detection that triggered it, so the client sees why the advice changed.

06 HISTORICAL & PREDICTIVE INTELLIGENCE

PAST → FUTURE

The advisor remembers and it anticipates. Immutable snapshots build a timeline of where the business has been; forecasting and simulation project where it is heading, always with widening confidence over the horizon.

Snapshots

Immutable point-in-time graph states, enabling exact reproduction and diffing of any past moment.

Historical intelligence

The full evidence and score history per account, queryable for context on any current finding.

Business health timeline

A continuous record of the Index and every dimension, annotated with the changes and moves that shaped it.

Long-term memory

Durable, isolated per-account memory that lets the advisor reason across the whole engagement, not just today.

Forecasting

Projects each dimension and the Index forward from trend, reported as a band that widens with horizon.

Scenario simulation

Models the projected effect of a candidate move or an external change before it happens.

Predictive intelligence

Anticipates likely change — a probable regression or opportunity — early enough to act ahead of it.

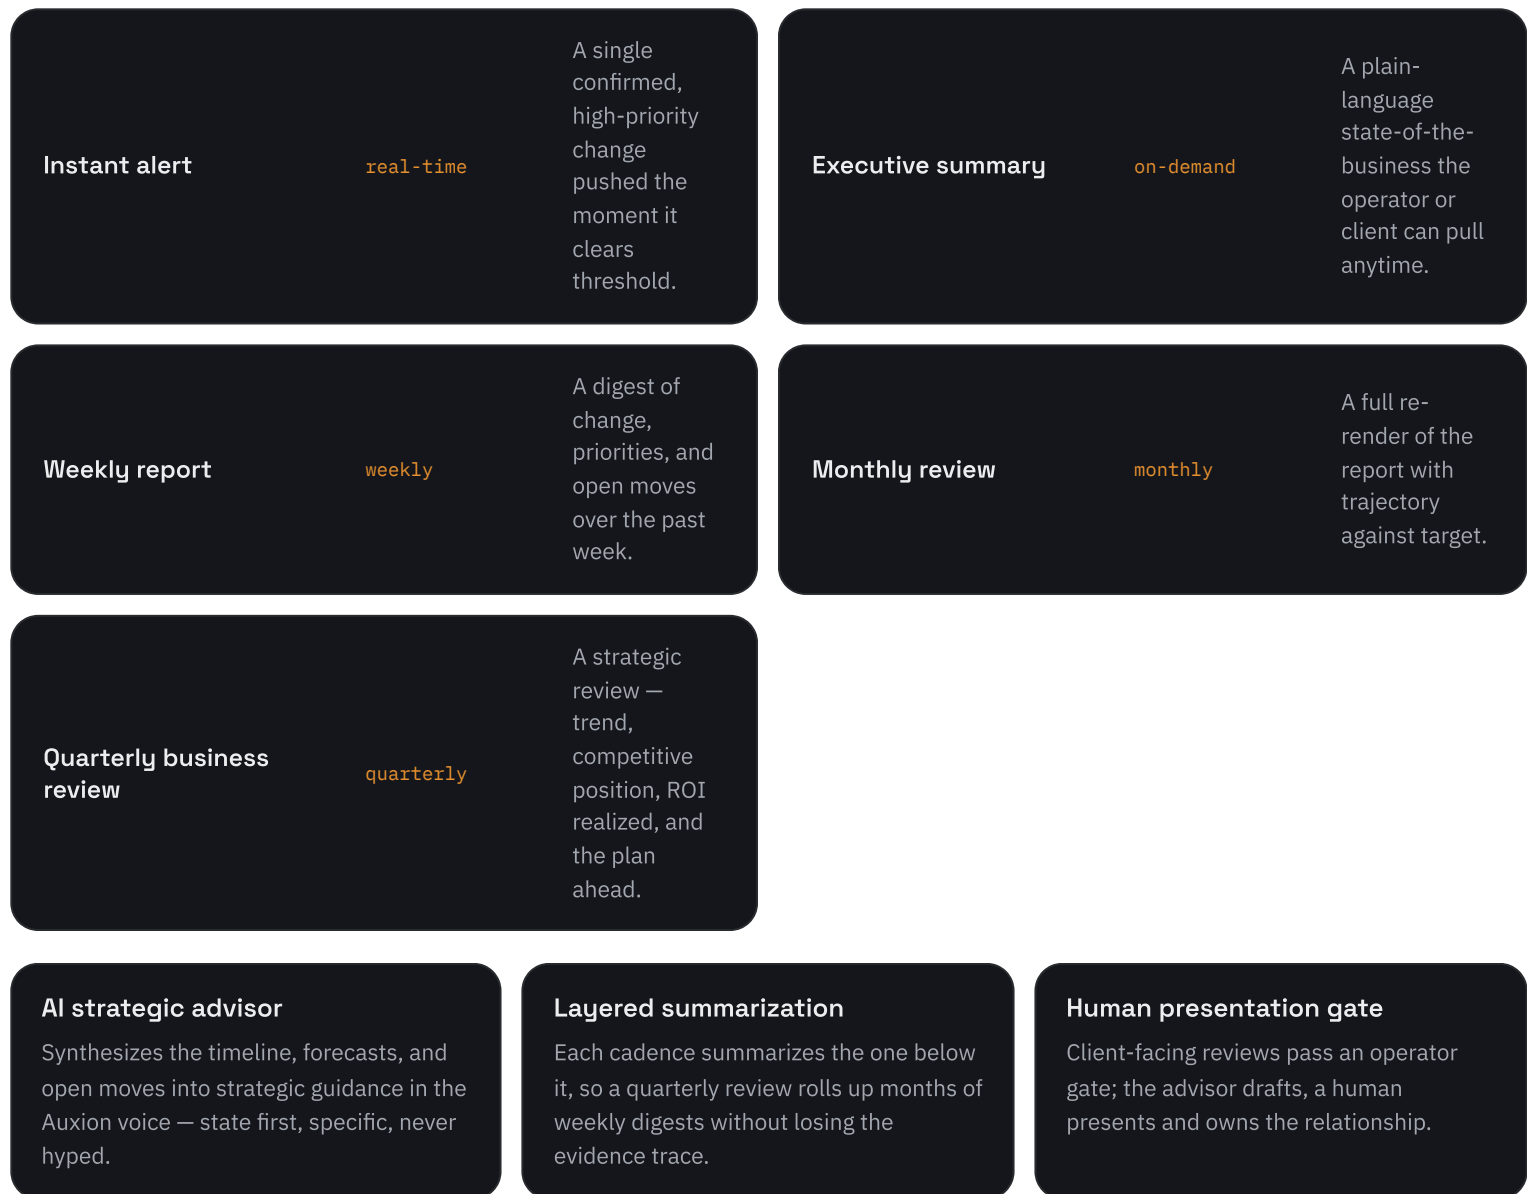

Drift-triggered rescans

A dimension whose confidence decays or whose trend drifts is auto-queued for a partial re-scan.

07 THE AUTONOMOUS ADVISOR

CADENCED REPORTING

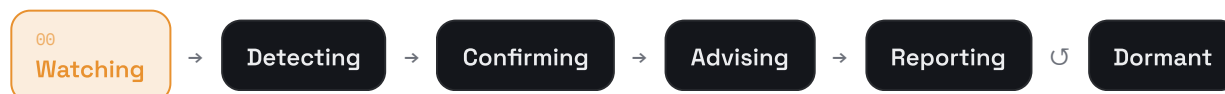

The advisor turns continuous intelligence into a rhythm of communication a client can rely on — from an instant alert to a quarterly business review — each layer summarizing the one below.

08 ADVISOR STATE MACHINE

6 STATES

A monitored account cycles through six states. The loop is continuous — Reporting returns to Watching until the engagement ends.

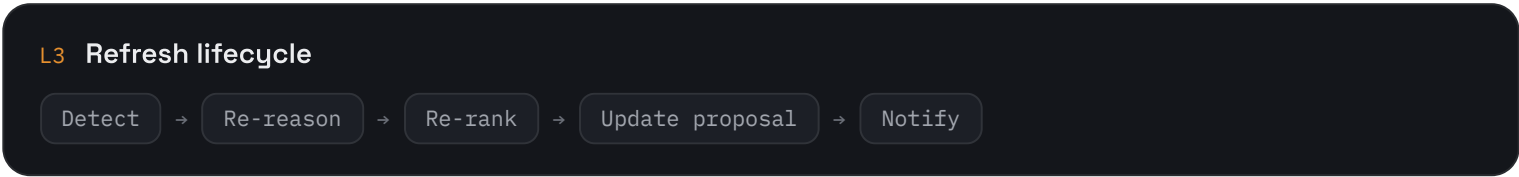

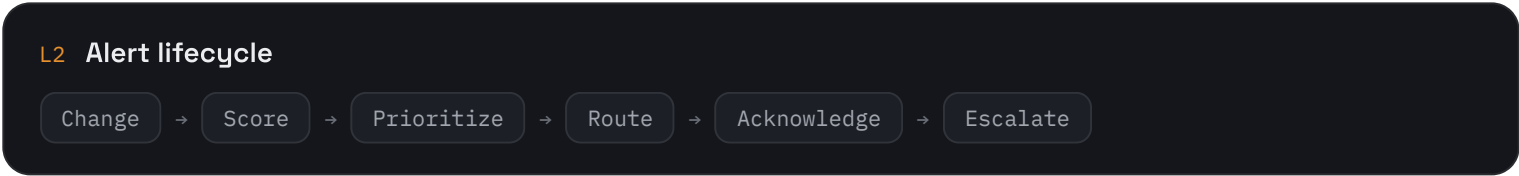

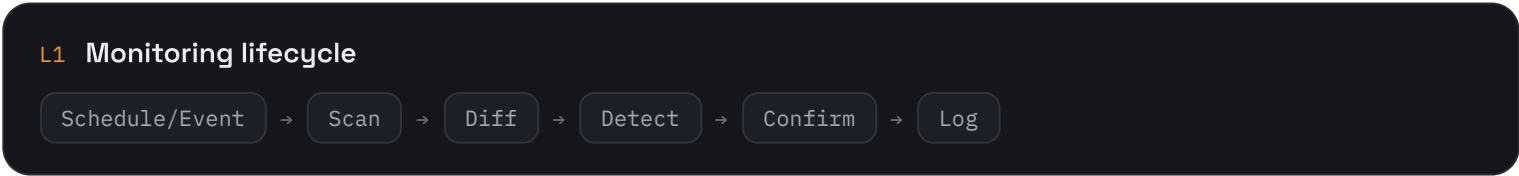

STATE	ON EXIT →	TRIGGER / RULE
Watching	Detecting	Steady state — monitors run on cadence and listen for events. Exits when a change is observed.
Detecting	Confirming / Watching	A delta is typed against the detection classes. A non-material delta returns to Watching, logged to the timeline.
Confirming	Advising / Watching	A candidate is re-checked to reject anomalies. A false positive returns to Watching; a real change proceeds.
Advising	Reporting	Recommendations and proposals refresh; a high-priority change raises an alert and may seek a human gate.
Reporting	Watching	The change is written to the timeline and the appropriate cadence report; the loop returns to Watching.
Dormant	Watching	Engagement paused or budget exhausted; monitoring suspended until resumed, with state preserved.
