

§01 · EXECUTIVE INSIGHT

Lead response is slipping because sales capacity concentrates before noon.

The Lead-Response Signal degraded 18% over three weeks. Auxion traced it past the symptom: 71% of inbound arrives 12:00–17:00, but 64% of rep availability sits 08:00–12:00. This is a scheduling structure fault, not a volume problem.

§02 EVIDENCE TIMELINE TRACEABLE

21 DAYS

Lead-Response Signal begins drifting

SIGNAL

First sustained dip below the 4h target. Observation window opened.

14 DAYS

Drift confirmed, not noise

CONFIRMED

Three consecutive days below target rules out a one-off spike.

6 DAYS

Inbound timing distribution mapped

ANALYSIS

71% of inbound lands 12:00–17:00 across 1,880 leads.

6 DAYS

Rep availability cross-referenced

ANALYSIS

64% of capacity sits 08:00–12:00 — an inverse of demand.

3 DAYS

Root cause isolated

INSIGHT

Structural scheduling mismatch, not headcount. Insight opened.

NOW

Two Moves drafted and simulated

MOVES

Both replayed against 1,880 historical leads; awaiting review.

§03 SUPPORTING SIGNALS

4 LINKED

SIGNAL	TRACE	READING	Δ	RELEVANCE
Lead Response		6.1 _H	+18%	PRIMARY
Inbound Volume		+4 %	flat	CONTEXT
Rep Util · AM		91 %	+6%	STRONG
Rep Util · PM		52 %	−9%	STRONG

§04

AI REASONING

AUXILIARY · SALES-02 · CHAIN

- 1

The Signal degraded steadily, not sharply — ruling out an outage or a single bad day.
↳ Lead-Response Signal · 21-day trace
- 2

Inbound volume held flat, so the cause is not more leads. Something changed in how fast they are handled.
↳ Inbound Volume Signal
- 3

Mapping arrival time against rep availability revealed an inverse distribution — demand peaks exactly when capacity troughs.
↳ Utilization AM vs PM
- 4

Conclusion: a scheduling structure fault. Shifting coverage — not hiring — should recover the Signal within one cycle.

§05

POTENTIAL MOVES

DECIDE → APPROVE

MV-121 · SALES

High

Shift 30% of rep coverage to the 12:00–17:00 window.

PROJECTED Index +3

MV-122 · SALES

Measured

Add an auto-acknowledge Routine for after-hours inbound.
